

San Pablo Bay Watershed Management Plan  
Draft May 2010

Due to limited funding, updated feasibility-level engineering and technical analyses have not been included in the document. Technical information and data reflected in the current document was substantially borrowed or replicated from the watershed study (circa 2000) and information developed during the implementation of the San Pablo Bay Watershed Restoration Program.

The San Francisco District would resume efforts under the program and progress in feasibility level analysis and planning for appropriate management measures, projects, etc. in the region. For now, the attached Draft San Pablo Bay Watershed Management Plan attempts to provide baseline information from our previous SPBW Framework Plan (an extensive assessment and plan that was produced in 2000 with our partners under the SPBWRP), as well as identify and discuss problems, opportunities, potential measures and potential projects in the region.
